

Memory at home

Design of an application to support the autonomy of the elderly

Marcos Carnerero, Sergio Gil, Yang Liu, María Moronta, María Sáez, Carmen Toribio

ESCUELA TÉCNICA SUPERIOR DE INGENIEROS INFORMÁTICOS

THE PROBLEM

Maintaining an organized routine is synonymous with autonomy for many seniors. But when they want to use technology, the organization can become a source of frustration.

TARGET AUDIENCE

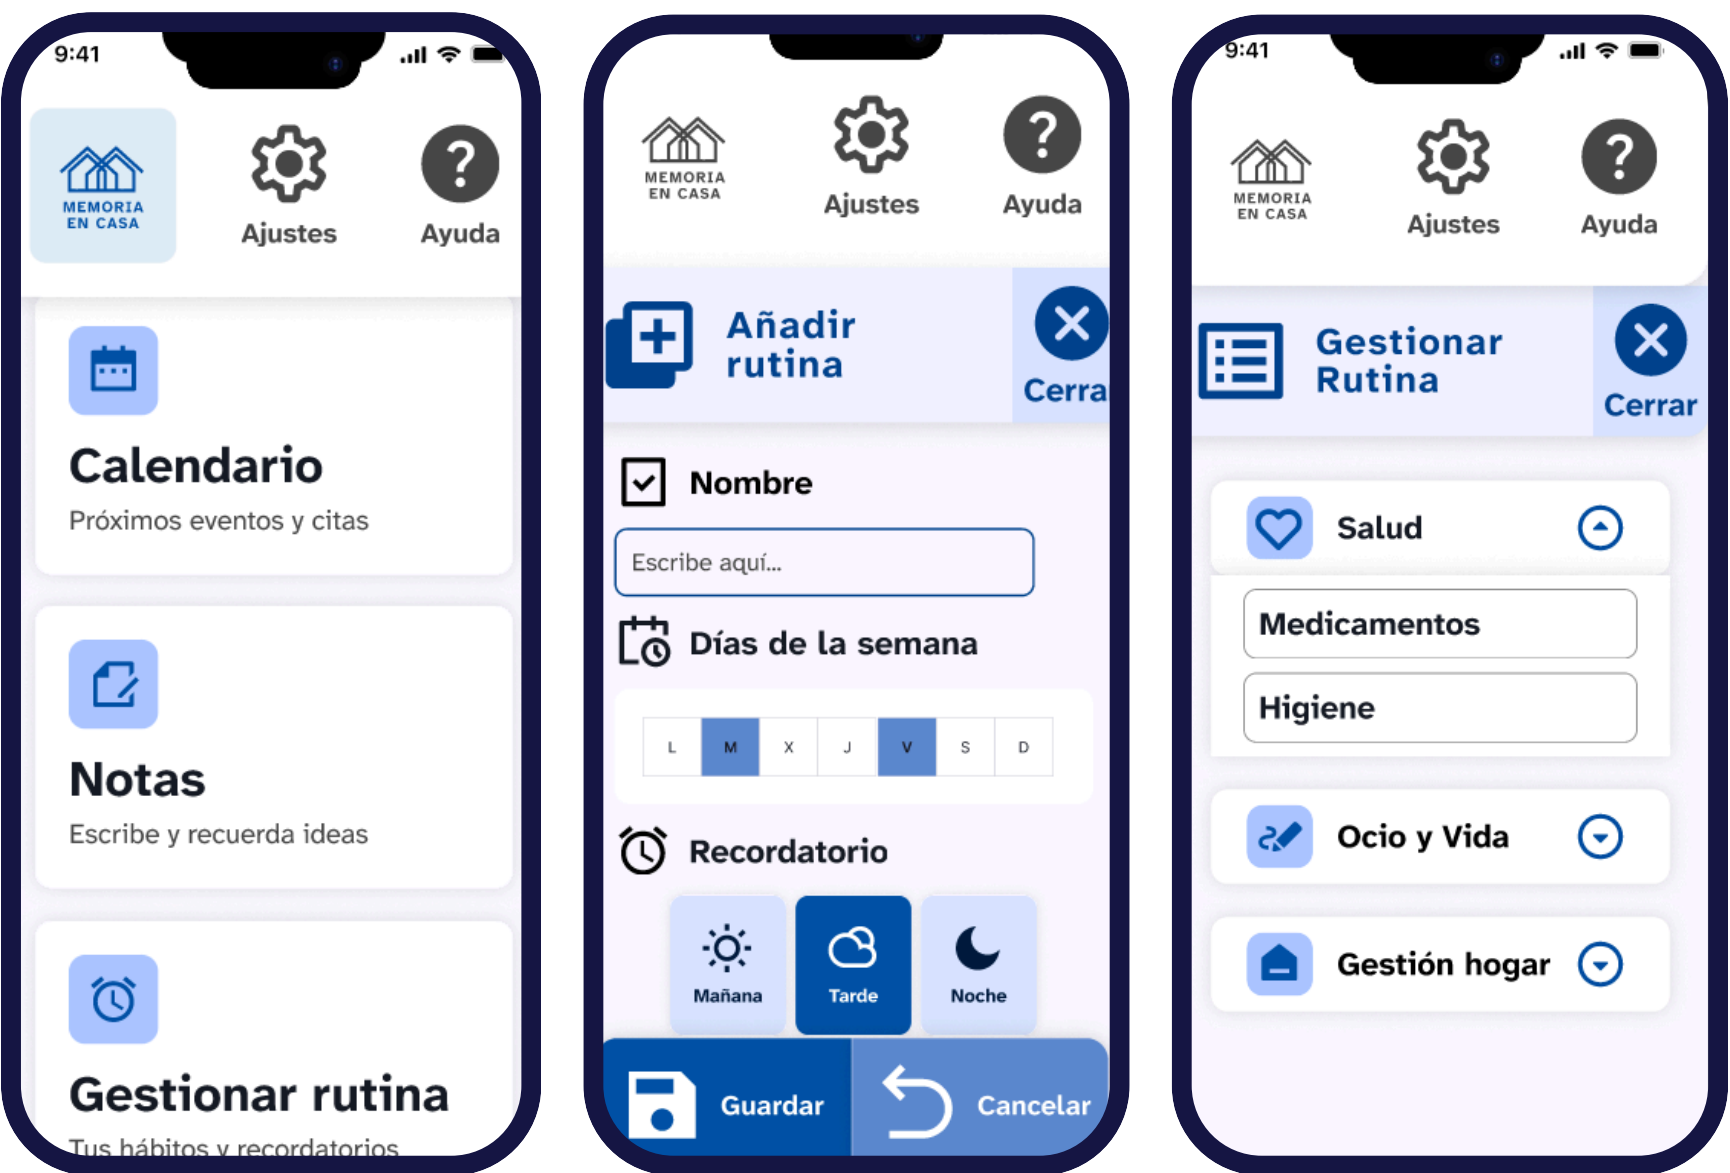

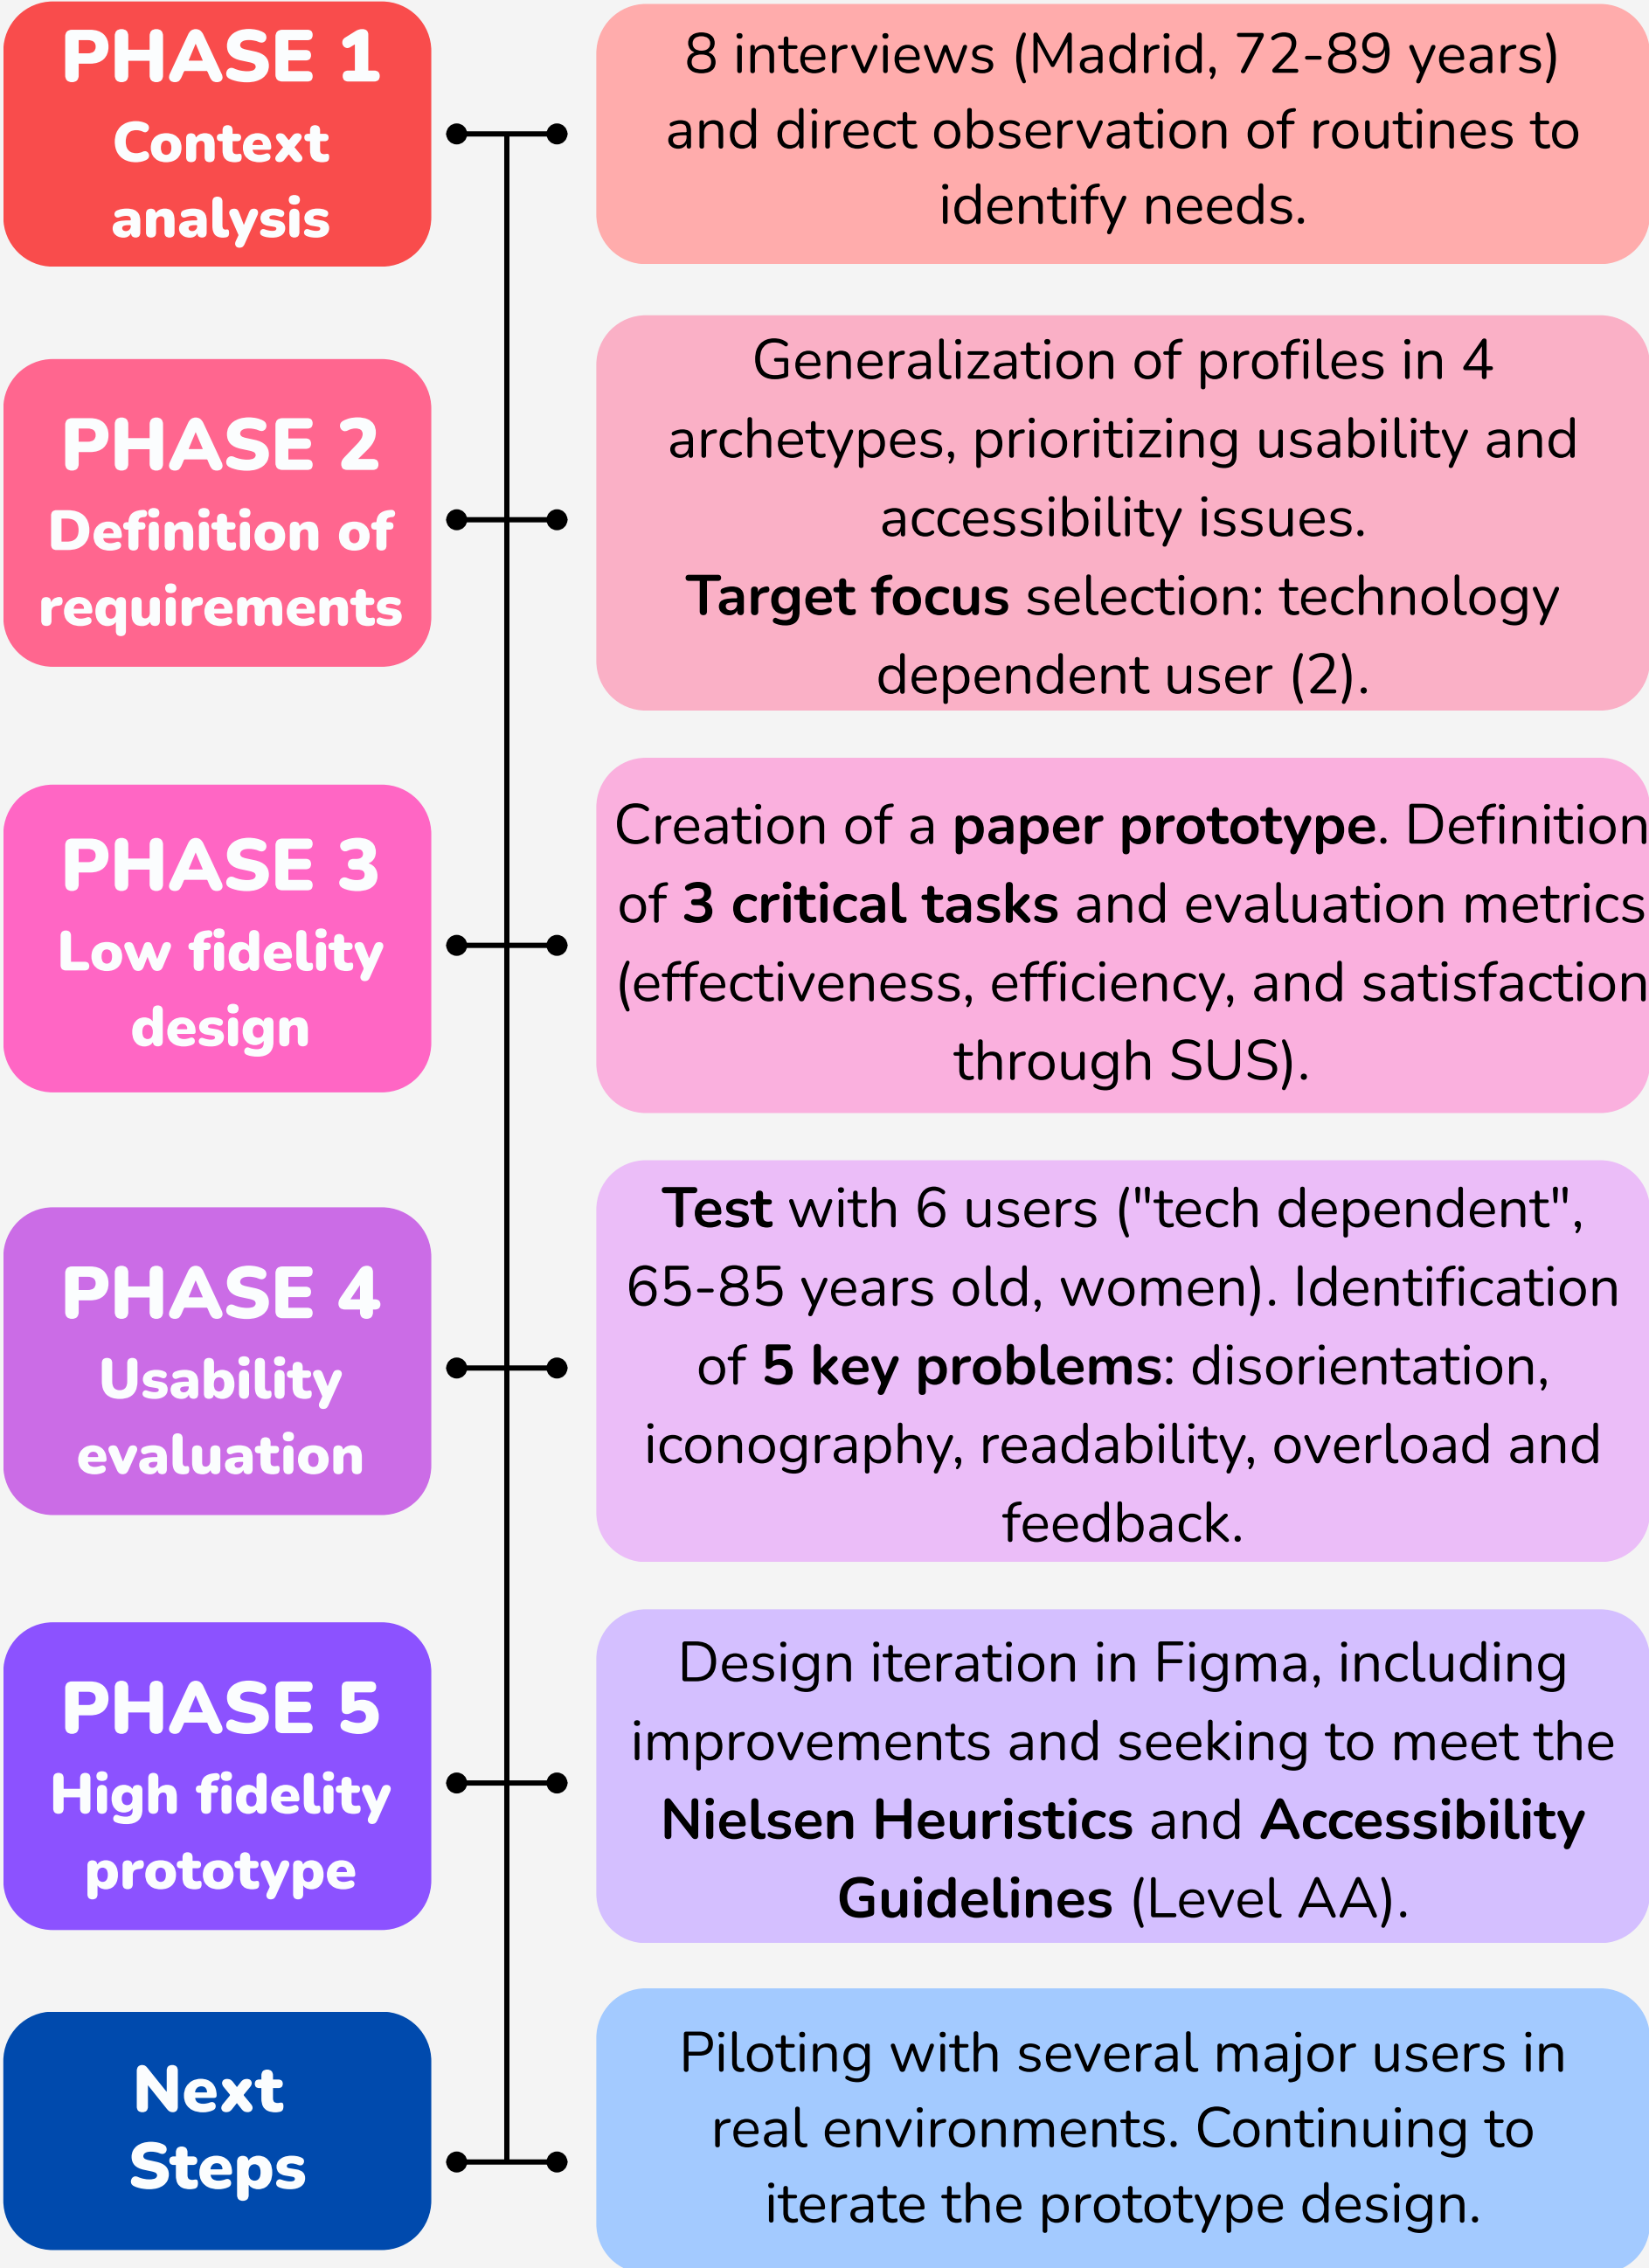

- 8 interviews 4 user profiles
- There is no single "major user".
- Focus on archetype 2

Archetype	Technological Level	Independence
1	High	Independent
2	Medium	Dependent
3	Low	Independent
4	Very Low	Dependent

ITERATIVE DESIGN

- Each iteration of the prototype has been guided by users' experiences, frustrations and ways of thinking.
- So, the problems that were detected have become design solutions. Because we didn't design for them; we designed with them.

METODOLOGÍA

THE PROTOTYPE

PROBLEMS AND SOLUTIONS

Problem	Implemented solution	Image
"I get lost, I don't know where I am"	Fixed navigation bar and always visible "Home" button	
"That symbol looks like something else..."	Buttons and icons with explanatory text	
"I can't see well, the print is very small"	Atkinson Hyperlegible font. Minimum size 18px.	
"There are too many things in the screen"	Progressive disclosure: fewer actions per screen	
"Oops, I don't know if I did it right"	Natural language confirmation messages	
"I need my daughter's help"	Guided tutorial to start and help section with FAQ and videos.
